AI Agents.

Generative AI

vs

AI Agent

vs

Agentic AI.

Generative AI

↳ Generates the content based on the prompt.

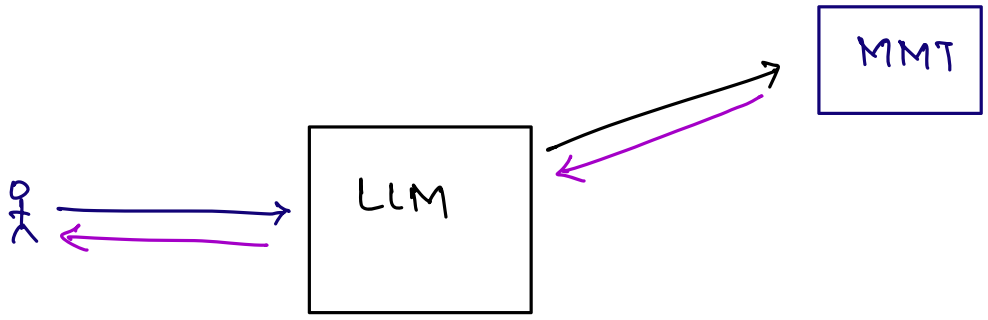
Ex: Give me a 3 days itinerary for Goa to visit with family.

AI Agent

↳ Show me the cheapest flights.

→ It not only responds but it also takes actions to perform a task.

→ Agents can make external tool calls like DB, APIs ....



Agentic AI

→ It is a more advanced form where the system can plan, think, take actions & work towards a goal.

→ It behaves like an autonomous problem-solver.

Gen AI ⇒ Responds

AI Agent ⇒ Acts.

Agentic AI ⇒ Plan, Think & Acts autonomously.

An agent usually has these parts :

→ Goal

→ Planning (or) Reasoning

→ Action (Tool Integration - APIs | DB | - - - -)

→ Memory

→ Execution loop.

Agent flow.

User Query → Agent Brain (Reasoning) → Tool Selection → Tool Call (Action) → Observe

ReAct Agents.

- Reason + Act.
- Thinks & take actions.
- It thinks about what to do next, performs the action, observe the results & repeat.

⇒ ReAct agent usual follows the below Pattern :

Thought : What should I do next ?

Action : Which tool to call ?

Action Input : What arguments / inputs should we pass to perform the action.

Observation : What did the tool return

Repeat until the final answer.

User asks:

“My order ORD-1002 has not arrived. Can I get a refund?”

The ReAct trajectory may look like this:

- Thought: I first need to check the order status.
- Action: get_order_status
- Action Input: {"order_id":"ORD-1002"}
- Observation: {"status":"in_transit","eta":"tomorrow"}

Then:

- Thought: Refund usually depends on delivery/cancellation policy. I should check refund eligibility.
- Action: refund_eligibility
- Action Input: {"order_id":"ORD-1002"}
- Observation: {"eligible":false,"reason":"Order still in transit"}

Then:

- Final Answer: “Your order is still in transit and is expected tomorrow, so a refund is not available yet.”
